What is REST?

REpresentational **S**tate **T**ransfer

Described by Roy Fielding in his dissertation

One of a number of “architectural styles”

Architectural principles underlying HTTP, defined *a posteriori*

See: <http://www.ics.uci.edu/~fielding/pubs/dissertation/top.htm>

REST Explained in 5 Easy Steps

0. Prerequisite: Let's equate "REST" with "RESTful HTTP usage" ...

1. Give Every “Thing” an ID

`http://example.com/customers/1234`

`http://example.com/orders/2007/10/776654`

`http://example.com/products/4554`

`http://example.com/processes/sal-increase-234`

2. Link Things To Each Other

```
<order self='http://example.com/customers/1234'>  
  <amount>23</amount>  
  <product ref='http://example.com/products/4554' />  
  <customer ref='http://example.com/customers/1234' />  
</order>
```

3. Use Standard Methods

| | |
|---------------|---------------------------------------|
| GET | retrieve information, possibly cached |
| PUT | Update or create with known ID |
| POST | Create or append sub-resource |
| DELETE | (Logically) remove |

4. Allow for Multiple “Representations”

GET /customers/1234

Host: example.com

Accept: application/vnd.mycompany.customer+xml

4. Allow for Multiple “Representations”

GET /customers/1234

Host: example.com

Accept: application/vnd.mycompany.customer+xml

<customer>...</customer>

4. Allow for Multiple “Representations”

GET /customers/1234

Host: example.com

Accept: application/vnd.mycompany.customer+xml

<customer>...</customer>

GET /customers/1234

Host: example.com

Accept: text/x-vcard

4. Allow for Multiple “Representations”

GET /customers/1234

Host: example.com

Accept: application/vnd.mycompany.customer+xml

<customer>...</customer>

GET /customers/1234

Host: example.com

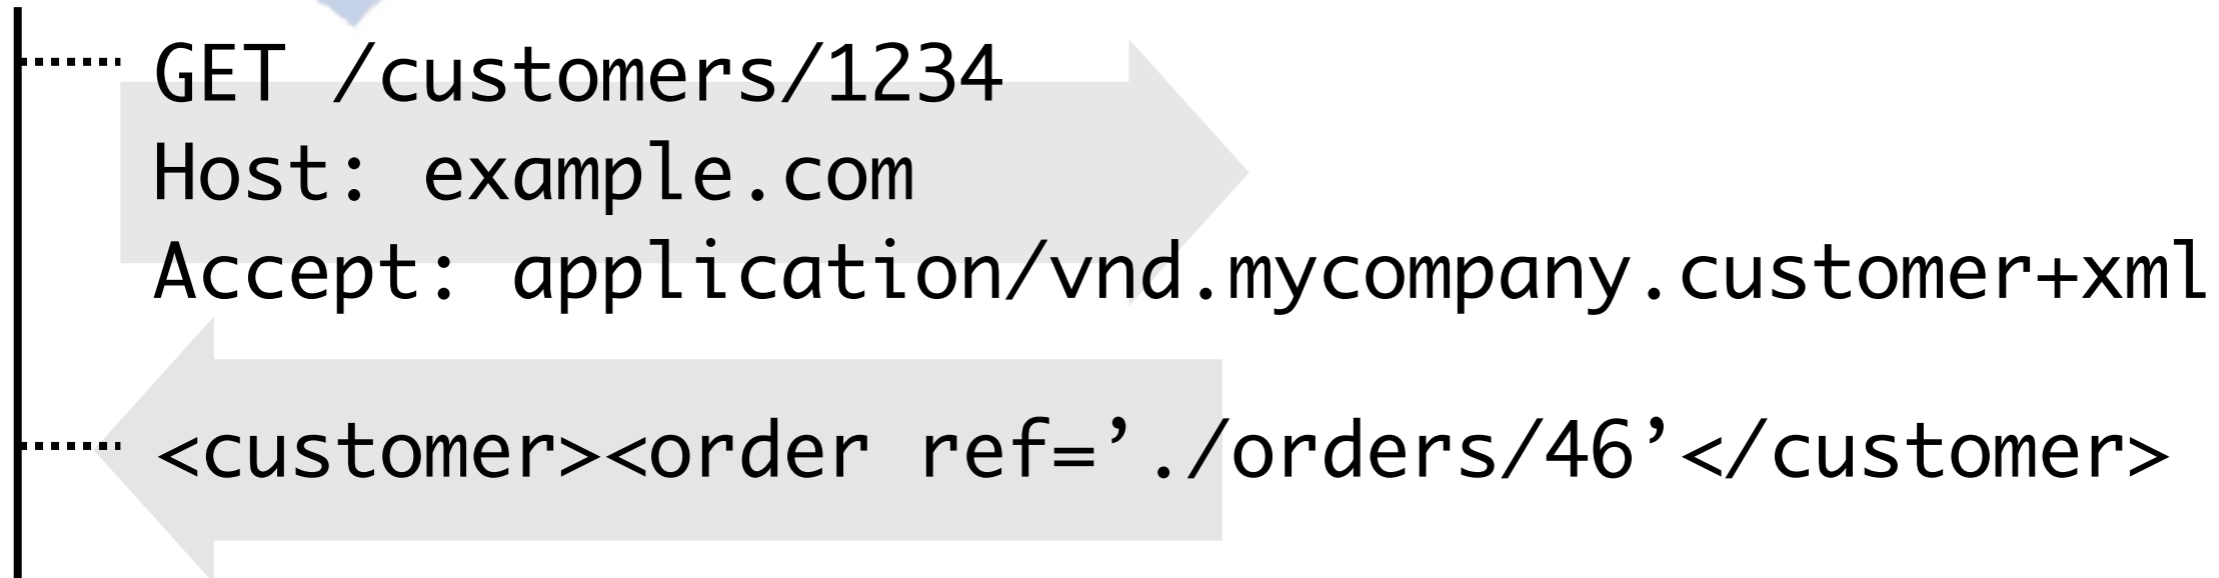

Accept: text/x-vcard

begin:vcard

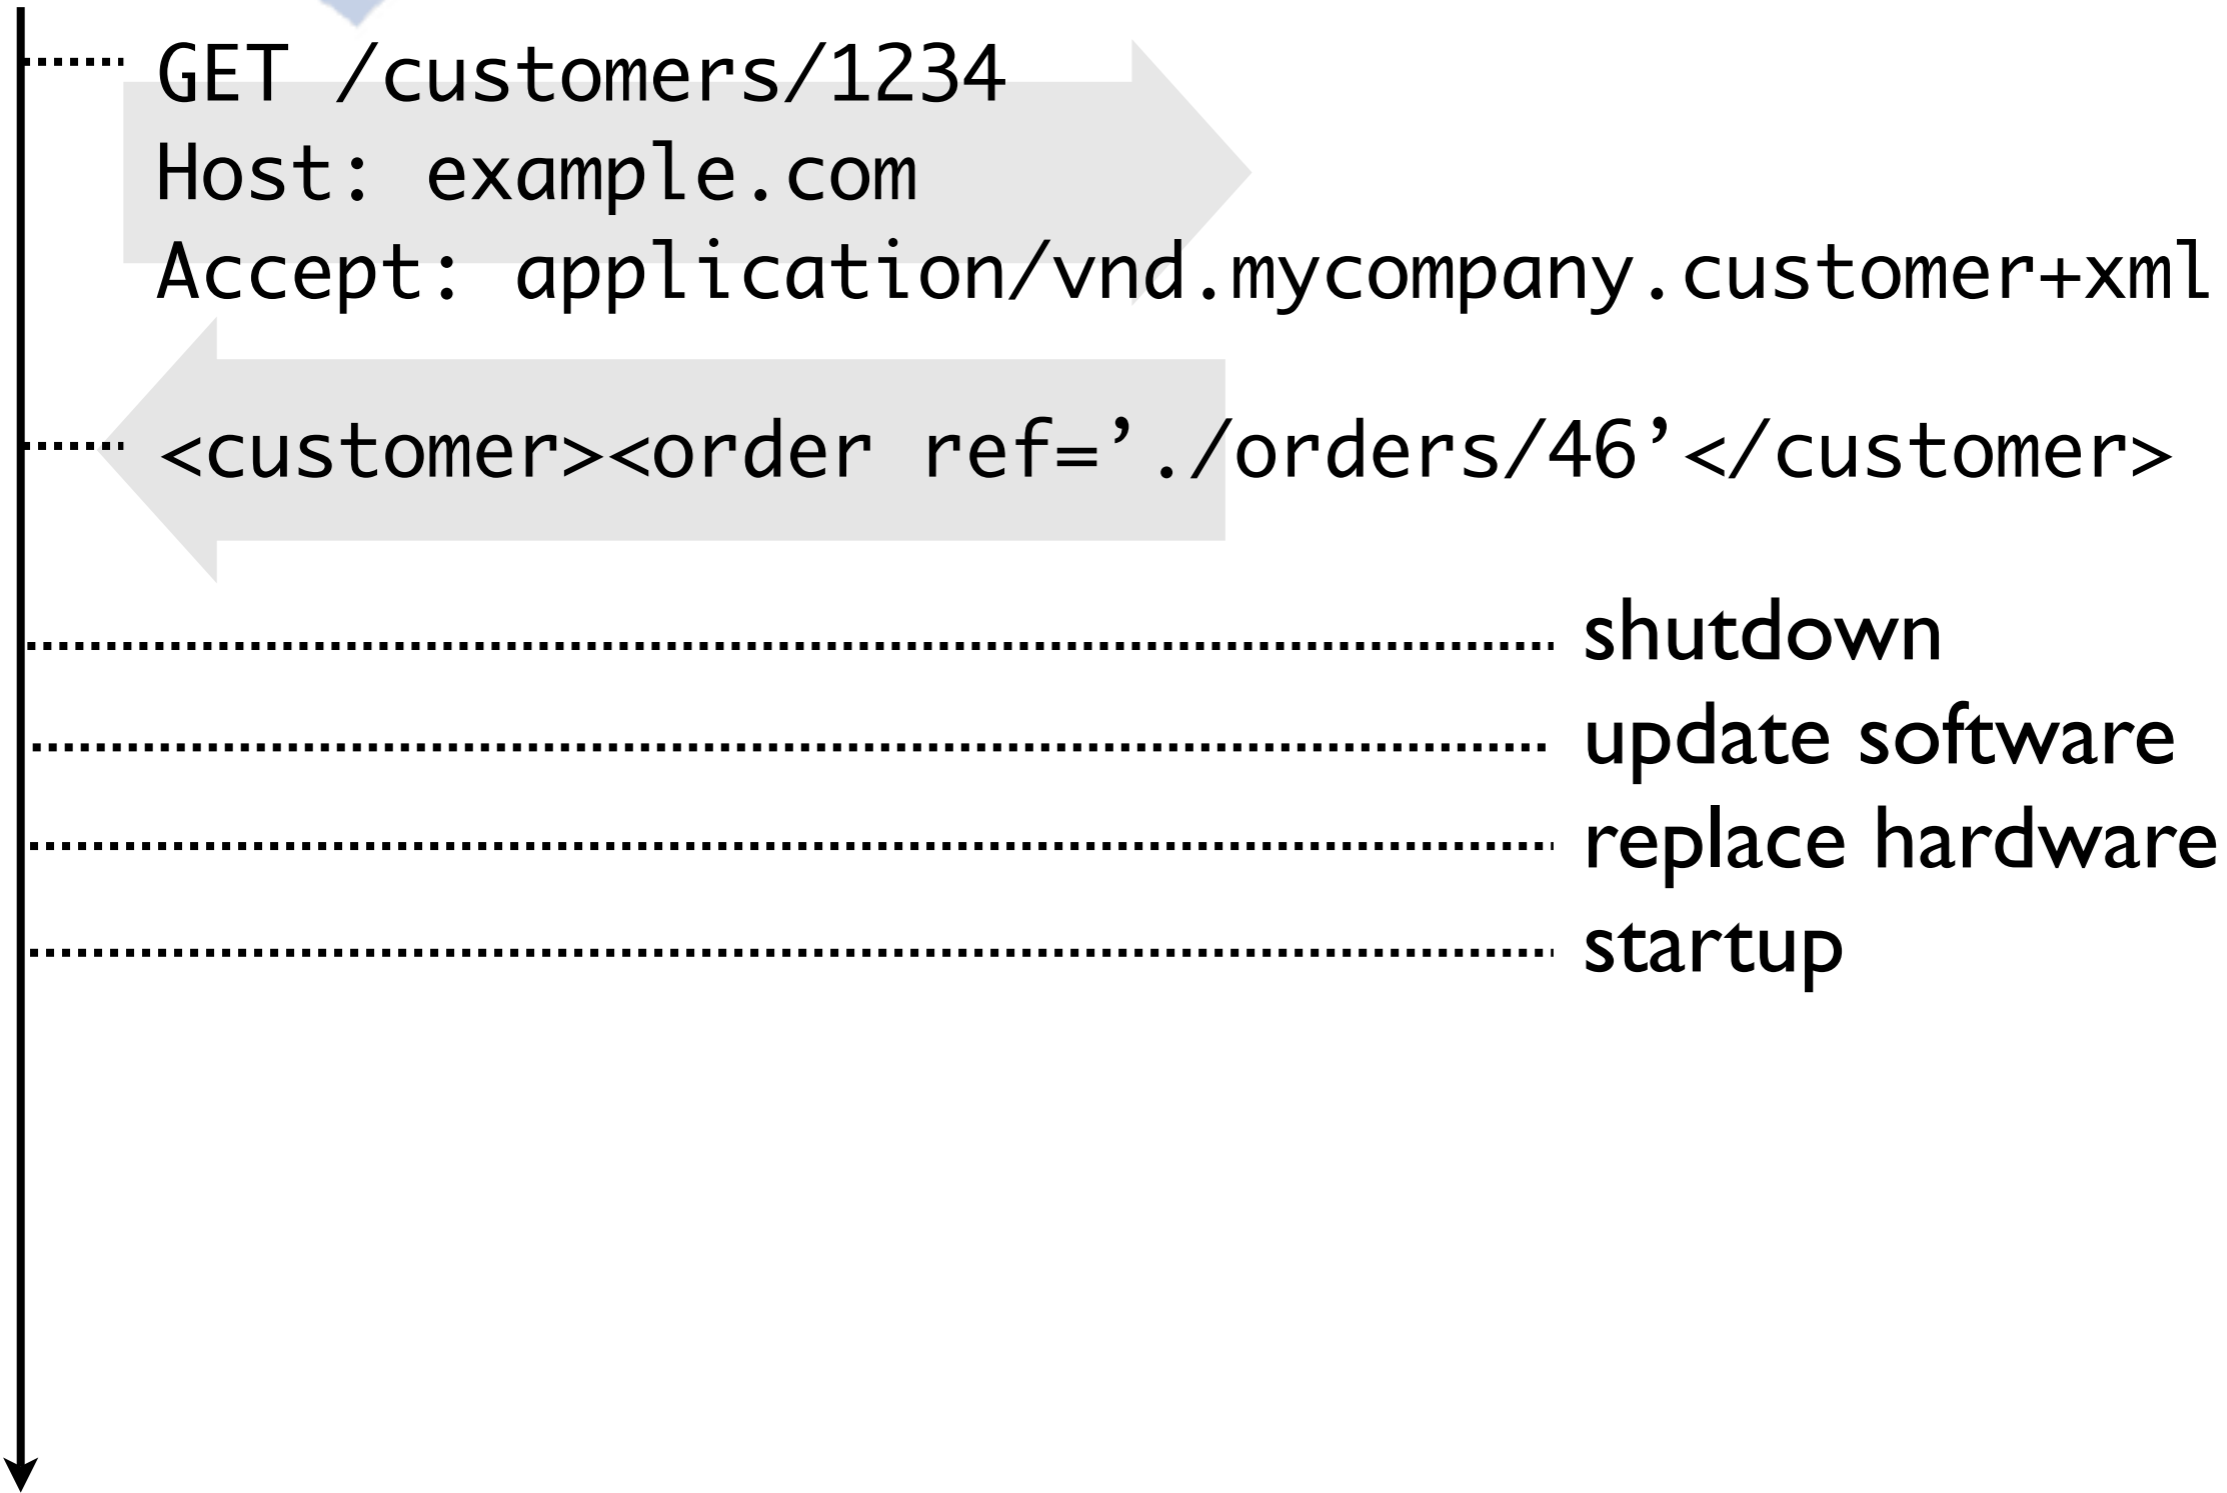

...

end:vcard

5. Communicate Statelessly

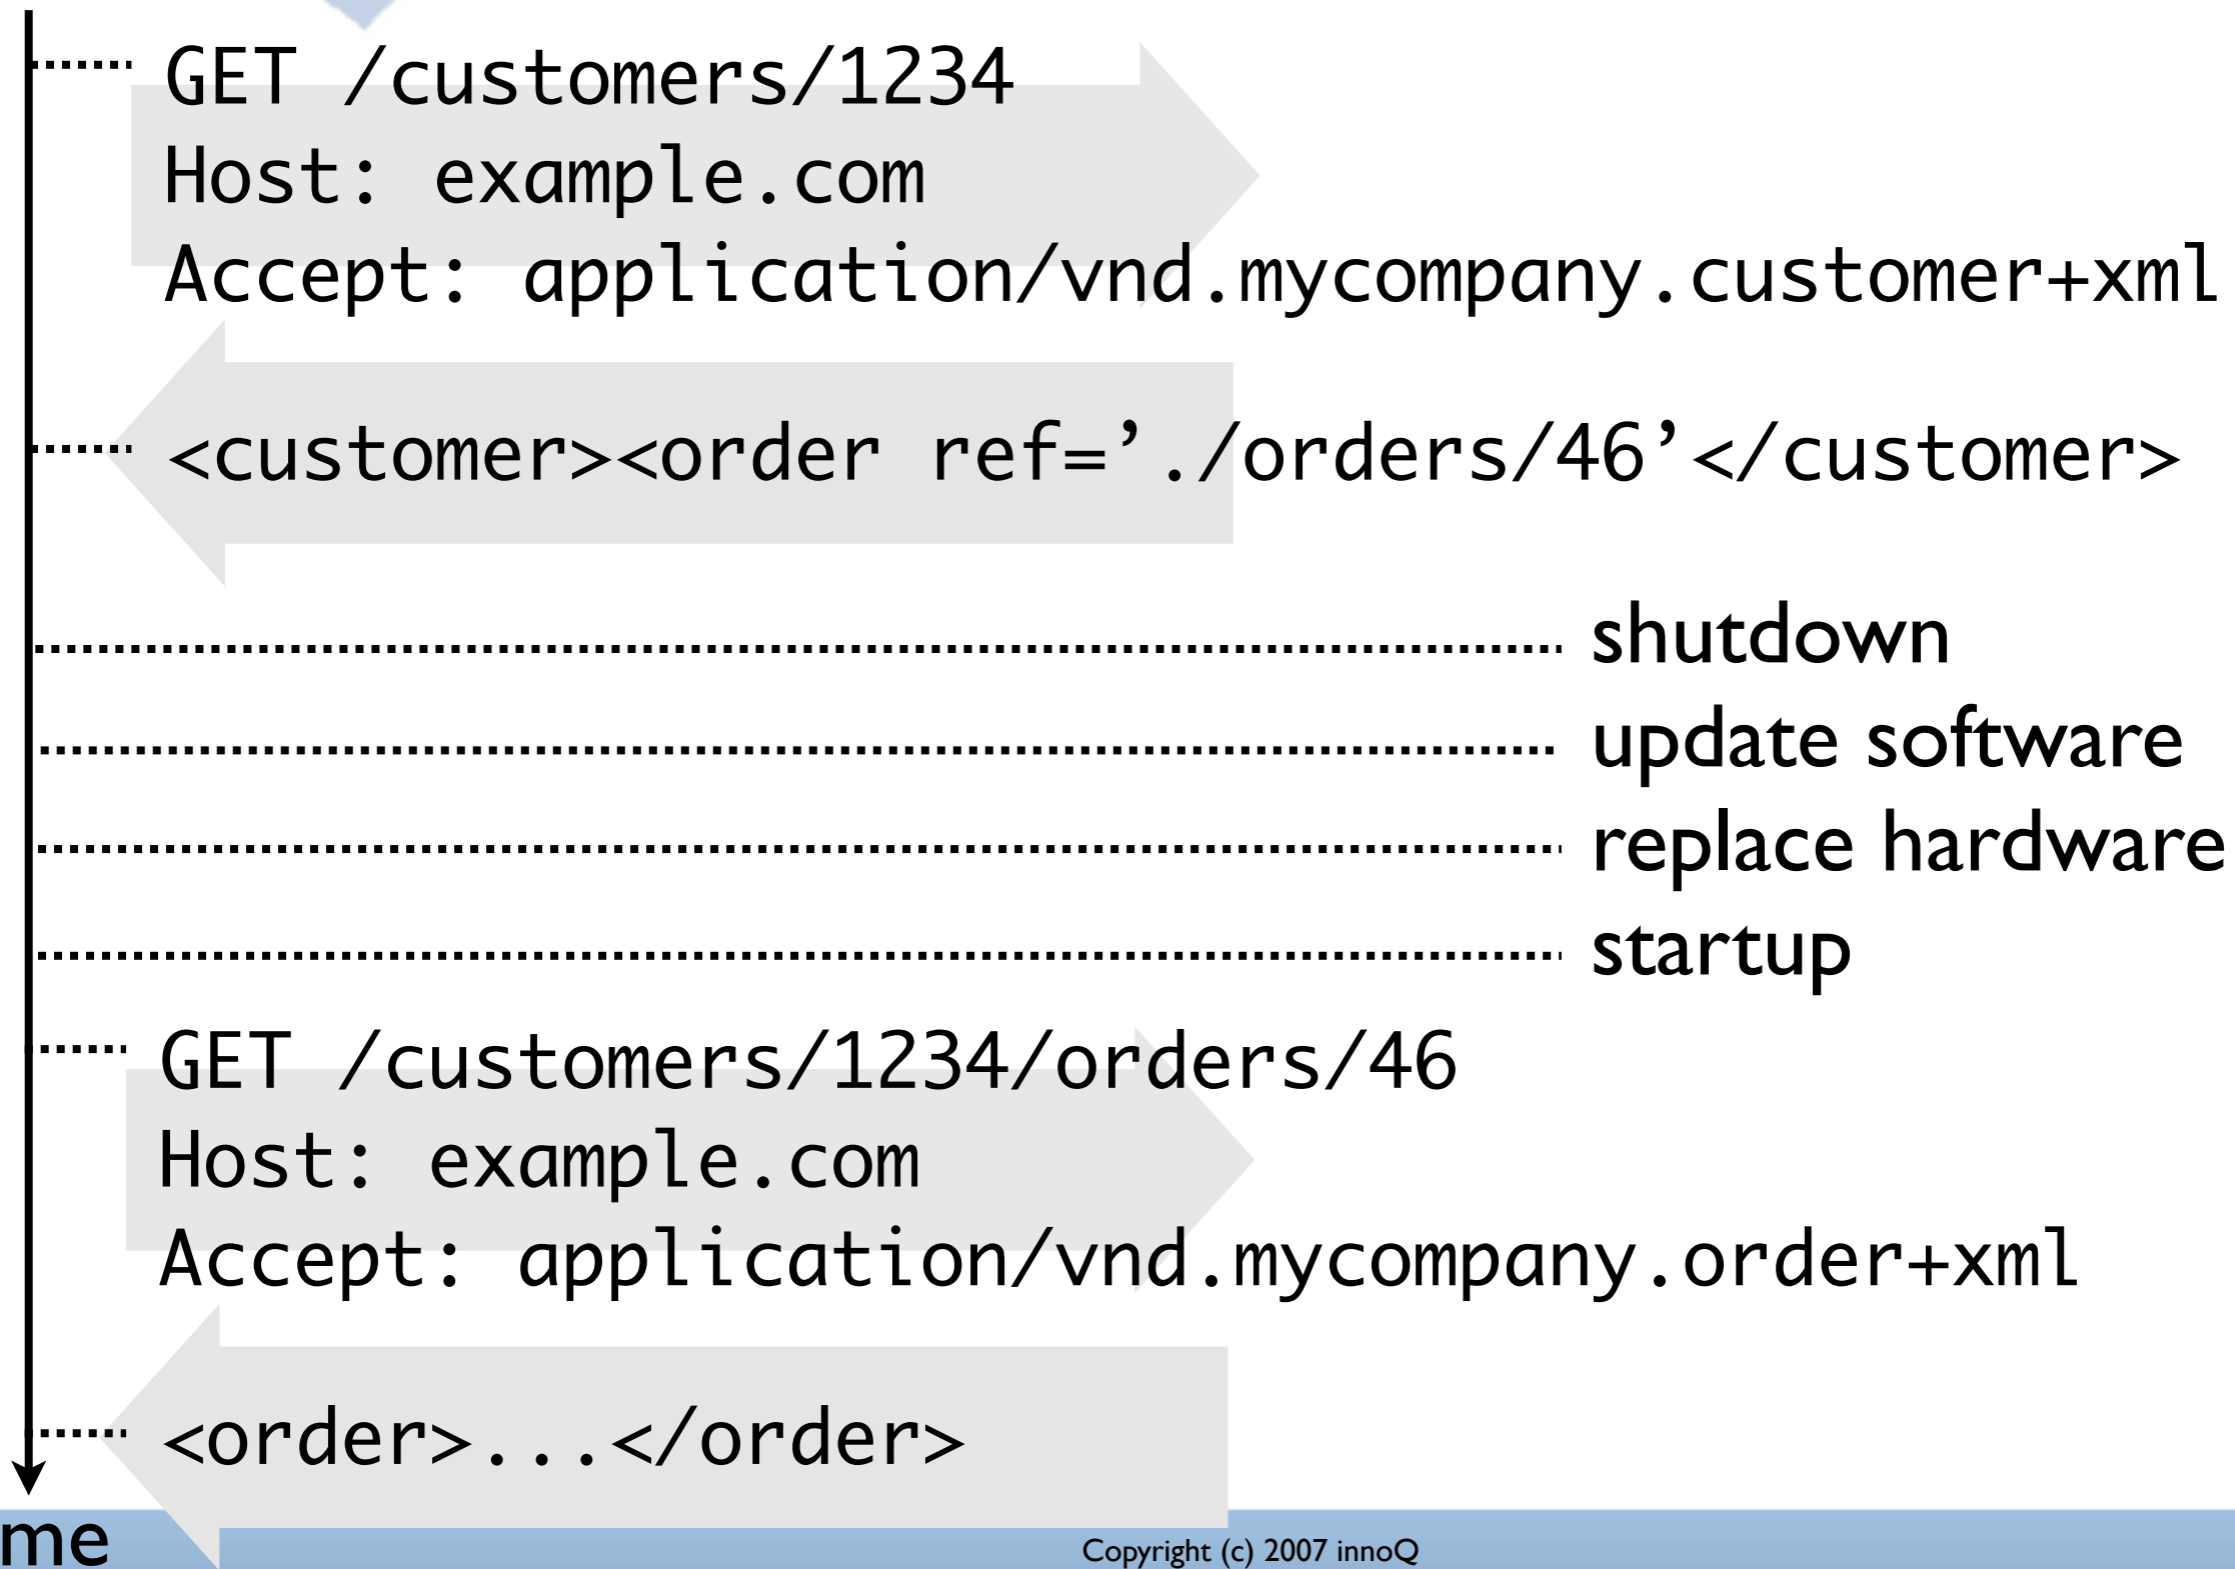

5. Communicate Statelessly

time

5. Communicate Statelessly

REST (Pragmatic Version)

- 1 Give everything an ID
- 2 Link things to each other
- 3 Use standard methods
- 4 Allow for multiple representations
- 5 Communicate Statelessly

REST (Academic Version)

- 1 Identifiable resources
- 2 **Hypermedia** as the engine of application state
- 3 Uniform interface
- 4 Resource representations
- 5 Stateless communication

Some HTTP features

Verbs (in order of popularity):

- ▶ GET, POST
- ▶ PUT, DELETE
- ▶ HEAD, OPTIONS, TRACE

Standardized (& meaningful) response codes

Content negotiation

Redirection

Caching (incl. validation/expiry)

Compression

Chunking

Web Services

OrderManagementService

- + getOrders()
- + submitOrder()
- + getOrderDetails()
- + getOrdersForCustomers()
- + updateOrder()
- + addOrderItem()
- + cancelOrder()
- + cancelAllOrders()

CustomerManagementService

- + getCustomers()
- + addCustomer()
- + getCustomerDetails()
- + updateCustomer()
- + deleteCustomer()
- + deleteAllCustomers()

A separate interface (façade) for each purpose

As known CORBA, DCOM, RMI/EJB

Often used for SOA (“CORBA w/ angle brackets)

Application-specific protocol

Contribution to the Net's Value

2 URLs

- ▶ `http://example.com/customerservice`
- ▶ `http://example.com/orderservice`

1 method

- ▶ `POST`

Web Services Issues

Web Services are “Web” in name only

WS-* tends to ignore the web

Abstractions leak, anyway

Protocol independence is a bug, not a feature

Designing a RESTful application

Identify resources & design URIs

Select formats (or create new ones)

Identify method semantics

Select response codes

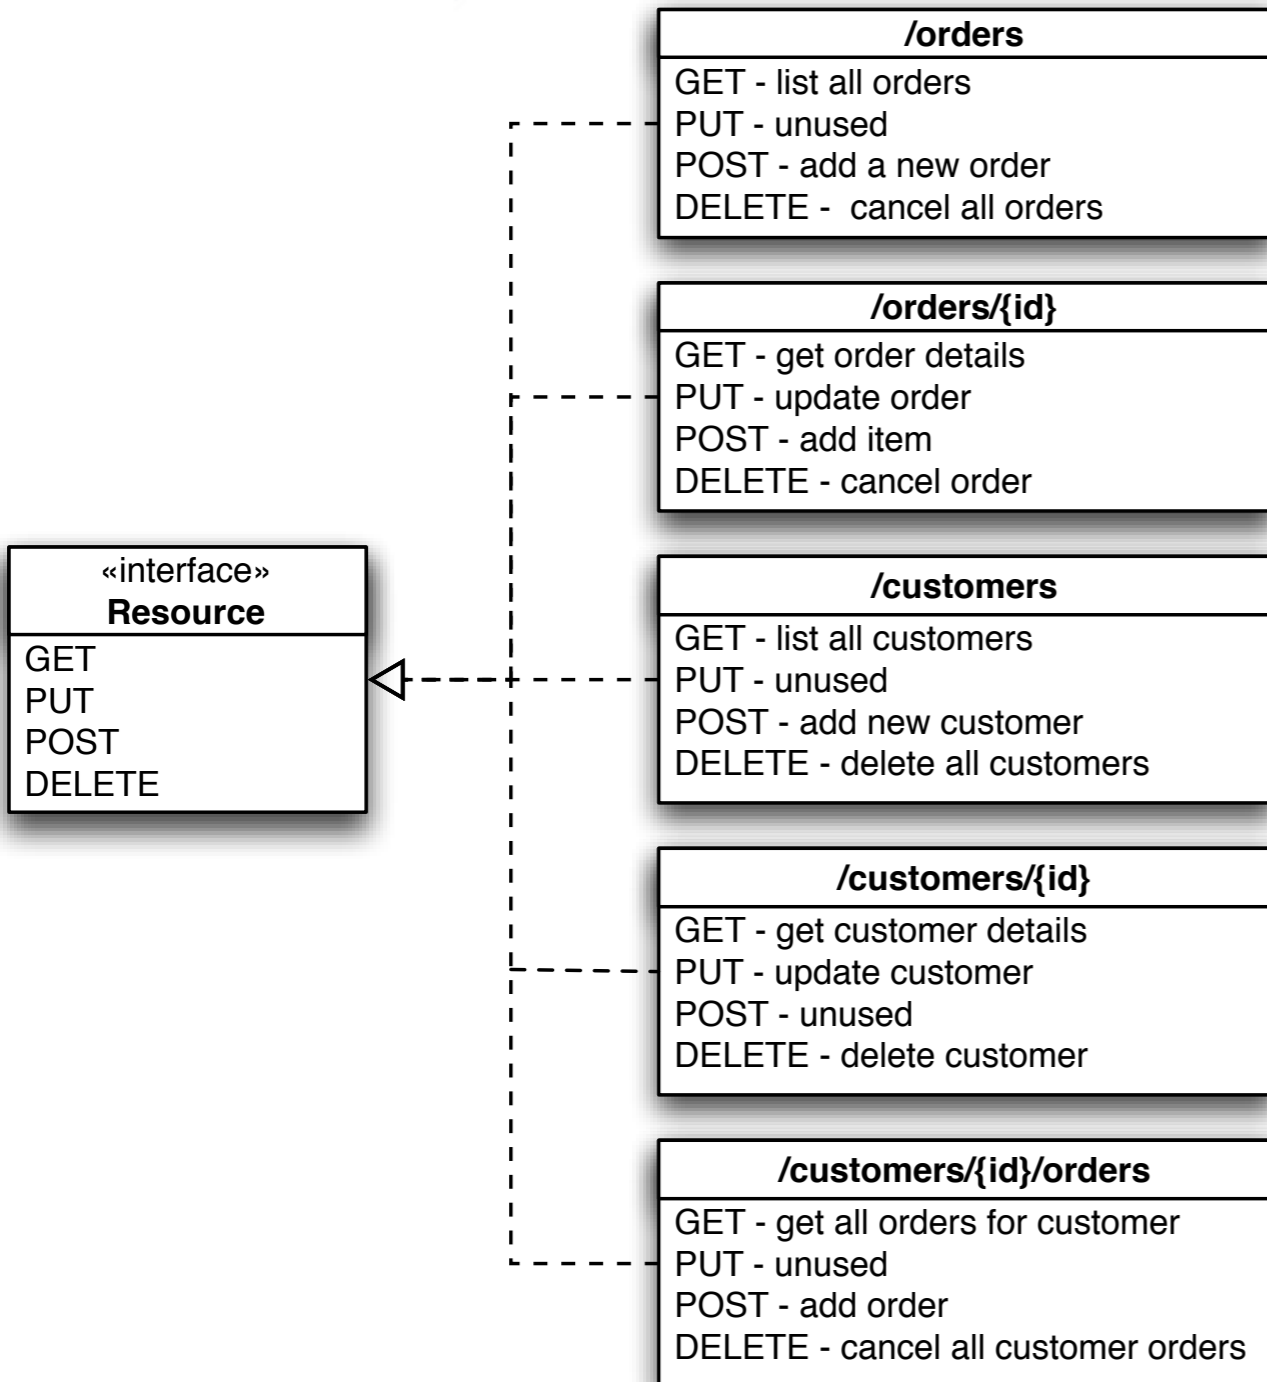

See: http://bitworking.org/news/How_to_create_a_REST_Protocol

REST Approach

A single *generic* (uniform) interface for everything

Generic verbs mapped to resource semantics

A standard application protocol (e.g. HTTP)

Contribution to the Net's Value

Millions of URLs

- ▶ every customer
- ▶ every order

4-7 supported methods per resource

- ▶ GET, PUT, POST, DELETE
- ▶ TRACE, OPTIONS, HEAD

Cacheable, addressable, linkable, ...

RESTful HTTP Advantages

Universal support (programming languages, operating systems, servers, ...)

Proven scalability

“Real” web integration for machine-2-machine communication

Support for XML, but also other formats

Why You Should Care

WS-* Roots

The Enterprise

RPC, COM, CORBA, RMI, EJB

Transaction Systems

Controlled Environment

Top-down Approach

REST Roots

The Internet

Text formats

Wire Standards

FTP, POP, SMTP

Bottom-up Approach

Internet vs. Enterprise

What's the difference between the Internet and a typical enterprise?

Internet vs. Enterprise

One is a gigantic, uncontrollable anarchy of heterogeneous systems with varying quality that evolve independently and constantly get connected in new and unexpected ways.

Internet vs. Enterprise

One is a gigantic, uncontrollable anarchy of heterogeneous systems with varying quality that evolve independently and constantly get connected in new and unexpected ways.

The other is a worldwide, publicly accessible series of interconnected computer networks that transmit data by packet switching using the standard Internet Protocol (IP).

If web services are supposed to work on Internet scale, they should be inspired by the Web, not by Distributed Objects

Quotes

*Frankly, if I were an enterprise architect today, and I were genuinely concerned about development costs, agility, and extensibility, I'd be looking to solve everything I possibly could with dynamic languages and REST, and specifically the HTTP variety of REST. I'd avoid **ESBs and the typical enterprise middleware frameworks unless I had a problem that really required them [...]. I'd also try to totally avoid SOAP and WS-***.*

Steve Vinoski, formerly IONA

<http://steve.vinoski.net/blog/2007/10/04/the-esb-question/>

*If you're ready for REST I suggest you jump on board right away and get ahead of the curve [...] You'll have to train your developers in REST principles. [...] You definitely need to provide guidance to your people. **What you want to do is work to the point where REST becomes the default for all your distributed applications.***

Anne Thomas Manes, Burton Group

http://searchwebservices.techtarget.com/originalContent/0,289142,sid26_gci1256796,00.html

*“Want to be cool? Learn REST.
Want a career? Learn WS.”*

Steve Jones, Cap Gemini

<http://service-architecture.blogspot.com/2006/11/want-to-be-cool-learn-rest-want-career.html>

JSR 311: JAX-RS: The Java™ API for RESTful Web Services

Goals

Create a Java API for building applications that are *on the Web easily*

Follow REST principles and best practices

Format-independent (not only XML)

HTTP-centric (no protocol independence)

Container-independent

Status

Spec and RI

Specification available at

<http://jcp.org/aboutJava/communityprocess/edr/jsr311/index.html>

Jersey (reference implementation from Sun),
currently at V0.4

<https://jersey.dev.java.net>

Approach

One class per resource “type”

Methods to handle HTTP requests

Use of Java 5 Annotations to specify

- ▶ URI Mapping
- ▶ Mapping to HTTP methods
- ▶ Mapping of URI components, HTTP headers, HTTP entities to method parameters and return types
- ▶ MIME type information

Example

| /customers |
|--|
| GET - list all customers PUT - unused POST - add new customer DELETE - delete all customers |

```
public class CustomersResource {
```

```
    public String getAsPlainText() {  
        return toString() + "\n\n";  
    }
```

```
}
```

Example

| /customers |
|--|
| GET - list all customers PUT - unused POST - add new customer DELETE - delete all customers |

```
@UriTemplate("/customers/")  
public class CustomersResource {
```

```
    public String getAsPlainText() {  
        return toString() + "\n\n";  
    }
```

```
}
```

Example

| /customers |
|--|
| GET - list all customers PUT - unused POST - add new customer DELETE - delete all customers |

```
@UriTemplate("/customers/")  
public class CustomersResource {
```

```
    @ProduceMime("text/plain")  
    public String getAsPlainText() {  
        return toString() + "\n\n";  
    }  
}
```

Example

| /customers |
|--|
| GET - list all customers PUT - unused POST - add new customer DELETE - delete all customers |

```
@UriTemplate("/customers/")  
public class CustomersResource {  
  
    @HttpMethod("GET")  
    @ProduceMime("text/plain")  
    public String getAsPlainText() {  
        return toString() + "\n\n";  
    }  
  
}
```

Example

| /customers |
|-------------------------------|
| GET - list all customers |
| PUT - unused |
| POST - add new customer |
| DELETE - delete all customers |

```
import javax.ws.rs.Produces;  
import javax.ws.rs.UriTemplate;  
import javax.ws.rs.HttpMethod;
```

```
@UriTemplate("/{customers/}")  
public class CustomersResource {
```

```
    @HttpMethod("GET")  
    @Produces("text/plain")  
    public String getAsPlainText() {  
        return toString() + "\n\n";  
    }  
}
```

```
}
```

@UriTemplate

URI Templates define URI strings with embedded variables

http://example.org/products/{upc}/buyers?page={page_num}

Based on Joe Gregorio's URI Templates
IETF Draft (see <http://bitworking.org/projects/URI-Templates/>)

@UriTemplate annotation can be applied
to classes or methods

@UriTemplate

@UriTemplate on a class “anchor” a class into URI space, relative to a base URI

Method-specific @UriTemplate is relative to the class URI

@UriParam, @QueryParam, @MatrixParam to access URI templates variables

@HttpMethod

@HttpMethod specifies the HTTP “verb” a method handles (GET, PUT, POST, DELETE, ...)

If not specified, verb default according to start of method name

HEAD and OPTIONS handled by implementation (unless overridden)

Example

```
@UriTemplate("/helloworld/{section}")
public class HelloWorldResource {

    @HttpMethod("GET")
    @UriTemplate("/{id}")
    public String findBySectionAndId(
        @UriParam("section") String section,
        @UriParam("id") int id) {
        return "Hello World - section is " + section
            + ", id is " + id + "\n";
    }
}
```

Example

```
@UriTemplate("/helloworld/{section}")  
public class HelloWorldResource {  
  
    @HttpMethod("GET")  
    @UriTemplate("/{id}")  
    public String findBySectionAndId(  
        @UriParam("section") String section,  
        @UriParam("id") int id) {  
        return "Hello World - section is " + section  
            + ", id is " + id + "\n";  
    }  
}
```

<http://localhost:9998/helloworld/main/23>

Example

```

@UriTemplate("/helloworld/{section}")
public class HelloWorldResource {

    @HttpMethod("GET")
    @UriTemplate("/{id}")
    public String findBySectionAndId(
        @UriParam("section") String section,
        @UriParam("id") int id) {
        return "Hello World - section is " + section
            + ", id is " + id + "\n";
    }
}

```

<http://localhost:9998/helloworld/main/23>

Hello World - section is main, id is 23

Content Negotiation: @ConsumeMime, @ProduceMime

@ConsumeMime and @ProduceMime specify accepted and delivered MIME types

Can be specified on class and method level (method level overrides)

Special treatment for `EntityProvider` classes

Request dispatching

1. Find class and method according to
 - ▶ Actual URI and `@UriTemplate`
 - ▶ HTTP method and `@HttpMethod`
 - ▶ “Content-type:” header and `@ConsumeMime`
 - ▶ “Accept:” header and `@ProduceMime`
2. Map `@UriParam`, `@QueryParam`, `@MatrixParam` parameters from URI
3. Map body (for POST and PUT) to unannotated parameter
4. Invoke method
5. Map return value (if any)

Example

```

@UriTemplate("customers/")
public class CustomersResource {

    @HttpMethod("GET") @ProduceMime("text/plain")
    public String getAsPlainText() {
        return toString() + "\n\n";
    }

    @HttpMethod("GET") @ProduceMime("application/vnd.innoq.customers+xml")
    public String getAsXml() {
        List<Customer> customers = Customer.findAll();
        // ...
        return elementToXmlString(root);
    }

    @HttpMethod("POST") @ConsumeMime("application/vnd.innoq.customer+xml")
    public Response newCustomer(String body) {
        // ...
    }

    @HttpMethod("DELETE")
    public Response delete(@UriParam("id") int id) {
        // ...
    }
}

```

EntityProvider

Converts between Java types and representations

Class marked with `@Provider`, implements `EntityProvider<T>`

Provides methods for conversion
InputStream/OutputStream to/from Java
object of type `T`

Example

```

@Provider
@ProducesMime({"application/vnd.innoq.customer+xml", "text/plain"})
@ConsumesMime("application/vnd.innoq.customer+xml")
public class CustomerEntityProvider implements EntityProvider<Customer> {
    public boolean supports(Class<?> type) {
        return Customer.class.isAssignableFrom(type);
    }

    public Customer readFrom(Class<Customer> type, MediaType mediaType,
        MultivaluedMap<String, String> httpHeaders,
        InputStream entityStream) throws IOException {
        Customer customer = ...
        return customer;
    }

    public void writeTo(Customer customer, MediaType mediaType,
        MultivaluedMap<String, Object> httpHeaders,
        OutputStream entityStream) throws IOException {
        OutputStreamWriter osw = new OutputStreamWriter(entityStream);
        osw.write(...);
        osw.close();
    }
}

```

Sub Resource support

Methods annotated with `@UriTemplate` but without `@HttpMethod` allow for hierarchical resources

Typical use: Collection resources

```
@UriTemplate("{id}")  
public CustomerResource customerById(@UriParam("id") int id) {  
    return new CustomerResource(Customer.get(id));  
}
```

Resource hierarchy

| /orders |
|----------------------------|
| GET - list all orders |
| PUT - unused |
| POST - add a new order |
| DELETE - cancel all orders |

"Root" resource collections

| /customers |
|-------------------------------|
| GET - list all customers |
| PUT - unused |
| POST - add new customer |
| DELETE - delete all customers |

| /orders/{id} |
|-------------------------|
| GET - get order details |
| PUT - update order |
| POST - add item |
| DELETE - cancel order |

Sub resources

| /customers/{id} |
|----------------------------|
| GET - get customer details |
| PUT - update customer |
| POST - unused |
| DELETE - delete customer |

| /customers/{id}/orders |
|-------------------------------------|
| GET - get all orders for customer |
| PUT - unused |
| POST - add order |
| DELETE - cancel all customer orders |

Nested resource collection

Response.Builder

Enables creation of objects with additional HTTP metadata

Builder pattern

```
return Response.Builder  
    .representation("Not found\n",  
                   "text/plain")  
    .status(404).build();
```

UriBuilder

Enables creation of URIs without repeating
URI template content

Used to support hypermedia - i.e., create
links

Builder pattern, again:

```
URI uri = UriBuilder
    .fromUri(BASEURI)
    .path(CustomersResource.class)
    .path(id).build();
```

@HttpContext

@HttpContext to access

- ▶ URI Info (Class `UriInfo`)
- ▶ HTTP Headers (Class `HeaderParam`)
- ▶ Preconditions (Class `HttpHeaders`)

Environments

Deployment to multiple different environments:

- ▶ Embedded HTTP Server (Java 6)
- ▶ Servlets
- ▶ Java EE
- ▶ JAX-WS
- ▶ Others (e.g. Restlet, ...)

Demo

Under Discussion

Refactoring of @HttpMethod:

```
@GET @Path( "/customers/{id}" )
```

JAX-RS Client API

“Platonic URIs”

(.xml, .json, ... instead of content negotiation)

...

What you can do

Read the spec!

Download and play with Jersey!

Provide feedback!

Thank you!

Any questions?
